

Lore

YOUR MAGIC SCROLL

A guide for new keepers. Ten minutes to read, fifteen to set up. Already set up? Your companion book is The Keeper's Grimoire.

WHAT IS LORE

Lore is a personal AI executive assistant that lives in a folder on your computer. Open that folder in Claude, either Cowork in the Claude desktop app or Claude Code, and the agent inside becomes yours: it learns your role, your team, your stakeholders, and your priorities, then puts that knowledge to work every day.

Lore is not a standalone application. It's a folder of configuration and instruction files that direct Claude, a tool your org has already approved, to act as a persistent assistant. It runs the same in Cowork or Claude Code, so use whichever you prefer. There is no separate executable, no server, and no account beyond the Claude access you already have. The folder is the brain. Every page of it is a plain file you can open, read, and edit.

WHAT IT DOES FOR YOU

THE QUEST LOG

A live action items tracker on claude.ai, private to you. New items Lore finds wait in a triage pile at the top for your one-click decision: do it now, mark it done, schedule it, delegate it, or delete it. Nothing joins your list without you.

THE HERALD

Your daily brief: one designed page that sweeps your email, Slack, and Teams, ranks what actually needs you, and holds a drafted reply for each item. Lore never sends anything. You do.

MEETING MEMORY

Drop in a transcript and Lore files the notes, updates its pages on the people involved, logs real decisions, and proposes the action items that were yours to keep.

PREP ON DEMAND

Ask for 1:1 prep, meeting prep, or a weekly review and Lore builds it from everything it has learned so far, not from a blank page.

THE ONE RULE WORTH KNOWING ON DAY 1

Lore drafts and holds; it never sends. Every message, reply, and update waits for your review. Treat it like a very fast chief of staff with no send button.

GETTING STARTED

Set up in 4 steps

You need Claude (Cowork or Claude Code) and about 15 quiet minutes.

1 PICK YOUR CLAUDE

Lore works in either. **Cowork** lives in the Claude desktop app (claude.ai/download), no terminal needed; **Claude Code** runs in your terminal or editor. Sign in with your work account.

2 GET THE LORE FOLDER ONTO YOUR MACHINE

From Lore's Releases page on GitHub (whoever shared Lore with you has the link), download the latest package zip and the installer for your computer. Double-click the installer and it puts everything in the right place. Mac: right-click the installer and choose Open the first time; Windows may show a SmartScreen prompt, choose "Run anyway".

Prefer doing it yourself? Unzip the package to `~/src/lore` on Mac or `C:\Users\<you>\src\lore` on Windows. Either way: no git, no command line, and updates come from the same Releases page with Lore applying them for you (see "Getting updates later" below).

3 OPEN THE FOLDER IN CLAUDE

In Cowork, choose the `lore` folder as your workspace; in Claude Code, run `claude` inside it. Everything Lore reads and writes stays there.

4 SAY HELLO

Lore notices a fresh install and runs a short onboarding interview: your role, your team, your key stakeholders, the tools you use, how you like to be spoken to, whether your outputs should wear your company's brand, and when you want your daily brief (morning, afternoon, or both). Skip anything that doesn't apply. Pause whenever you want and say "run onboarding" to pick it back up.

WHAT YOU'LL HAVE WHEN THE INTERVIEW ENDS

- A master profile of you and your work that Lore reads at the start of every session.
- A page for each teammate and stakeholder, ready to grow as meetings happen.
- The quest log, a private page on claude.ai, empty and waiting for its first entry.
- Your daily brief on a weekday schedule, if your channels are connected, and your first Herald delivered on the spot so you see it working.
- An assistant that already writes in your preferred tone.

GETTING UPDATES LATER

New versions of Lore ship regularly. Say **"update Lore"** anytime: Lore applies it, then walks you through any setup steps it needs. Your own files are never overwritten. What changed: **The Keeper's Grimoire**.

Day to day

You don't need to memorize prompts. Describe what you want and Lore finds the right playbook.

YOU WANT TO	SAY SOMETHING LIKE
See your open tasks	`"Show my action items"`
Process a meeting	`"Process this transcript"` (paste it or drop the file in)
Digest raw notes	`"I have some notes to process"`
Prep for a 1:1	`"Prep for my 1:1 with [name]"`
Start the day	`"Morning sync"`
Sweep your channels	`"Triage everything"`
End the week	`"Run my weekly review"`
Pressure-test a plan	`"Poke holes in this"`

THE QUEST LOG, UP CLOSE

New items arrive as proposals. When Lore pulls action items out of a transcript, they arrive in a triage pile at the top of the tracker, one card at a time. Each card takes one click: **Do now**, **Already done**, **Schedule**, **Delegate**, or **Delete**. That click is the decision; there is no second step.

Add your own at the top. The add form sits above the list: subject, who it came from, when it's due, and optional notes. Due dates are ASAP, TBD, a real date, or your own words.

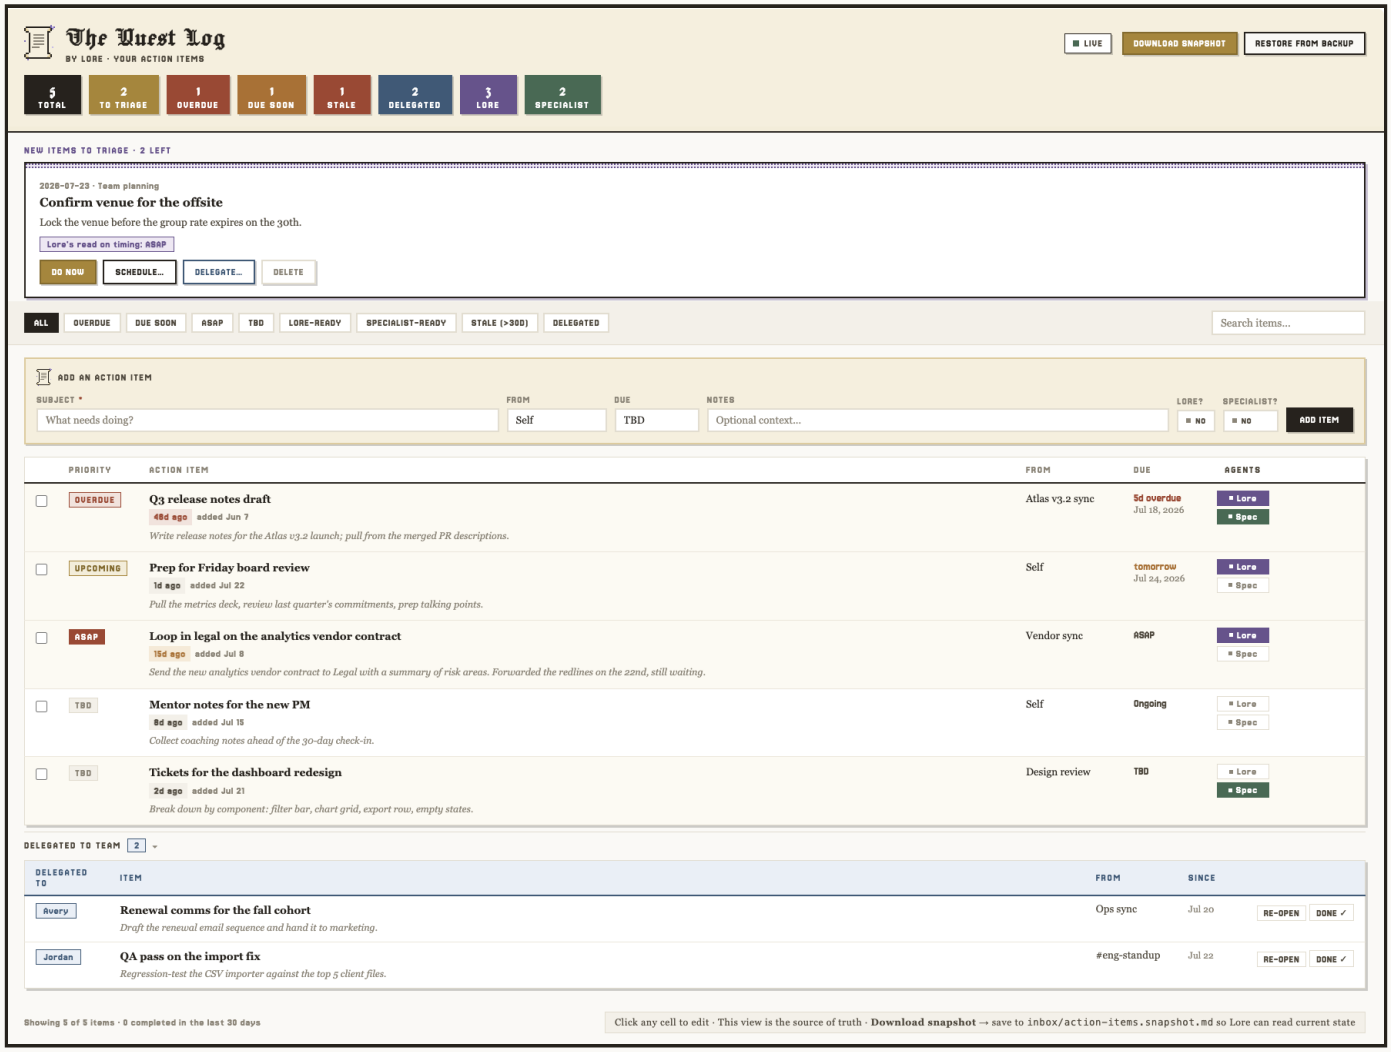

One list, two hands on it. You work in the tracker; Lore reads and writes the same list directly. There is nothing to export or sync, and changes Lore makes appear while you watch.

RITUALS THAT PAY FOR THEMSELVES

CADENCE	RITUAL
DAILY	Clear the triage pile; scan the quest log for blockers.
BEFORE 1:1S	Ask for prep. Lore reads that person's page first.
AFTER MEETINGS	Drop the transcript in; approve what Lore proposes.
FRIDAY	Run the weekly review while the week is still warm.
MONTHLY	Tell Lore what changed: priorities, initiatives, people.

The Quest Log

The triage card waits on top, the log sits below, and delegated quests keep their own ledger.

LEVELING UP

Connect your tools

All optional. Lore is useful on day 1; connectors are what make it formidable.

LORE ASKS, YOU ANSWER

During onboarding Lore checks which connectors your Claude setup can already reach, then asks what you use for each job: email, team chat, calendar, meeting notes, work tracker, docs. Whatever is connected gets wired in; for anything that isn't, Lore tells you where to connect it (claude.ai, Settings, Connectors). Say **"check my connectors"** anytime after adding one.

EMAIL AND TEAM CHAT

Connect them and say **"triage everything."** Lore sweeps your inbox and chats, ranks what needs you, and holds a drafted reply for each, written in your voice, as a native draft where the tool allows. Every run also delivers the Herald, your designed daily brief (next page).

MEETINGS, TICKETS, DOCS

A recorder or meeting-notes connector feeds transcripts straight in. A work tracker (Linear, Jira, Asana) and a docs tool (Notion, Confluence, Drive) let Lore ground briefs and drafts in the real tickets and pages behind a thread.

TIPS FROM EXPERIENCED KEEPERS

BE SPECIFIC

"The quoting integration is blocked on the vendor" beats "team issue." Names, dates, and stakes give Lore something to work with.

FEED THE BRAIN

Drop relevant docs into `inbox/documents/` and ask Lore to ingest them. The more it knows, the sharper everything downstream gets.

CHALLENGE BACK

Ask "what am I missing?" or "argue the other side." Lore is at its best when you use it as a sparring partner, not a stenographer.

EDIT ANYTHING

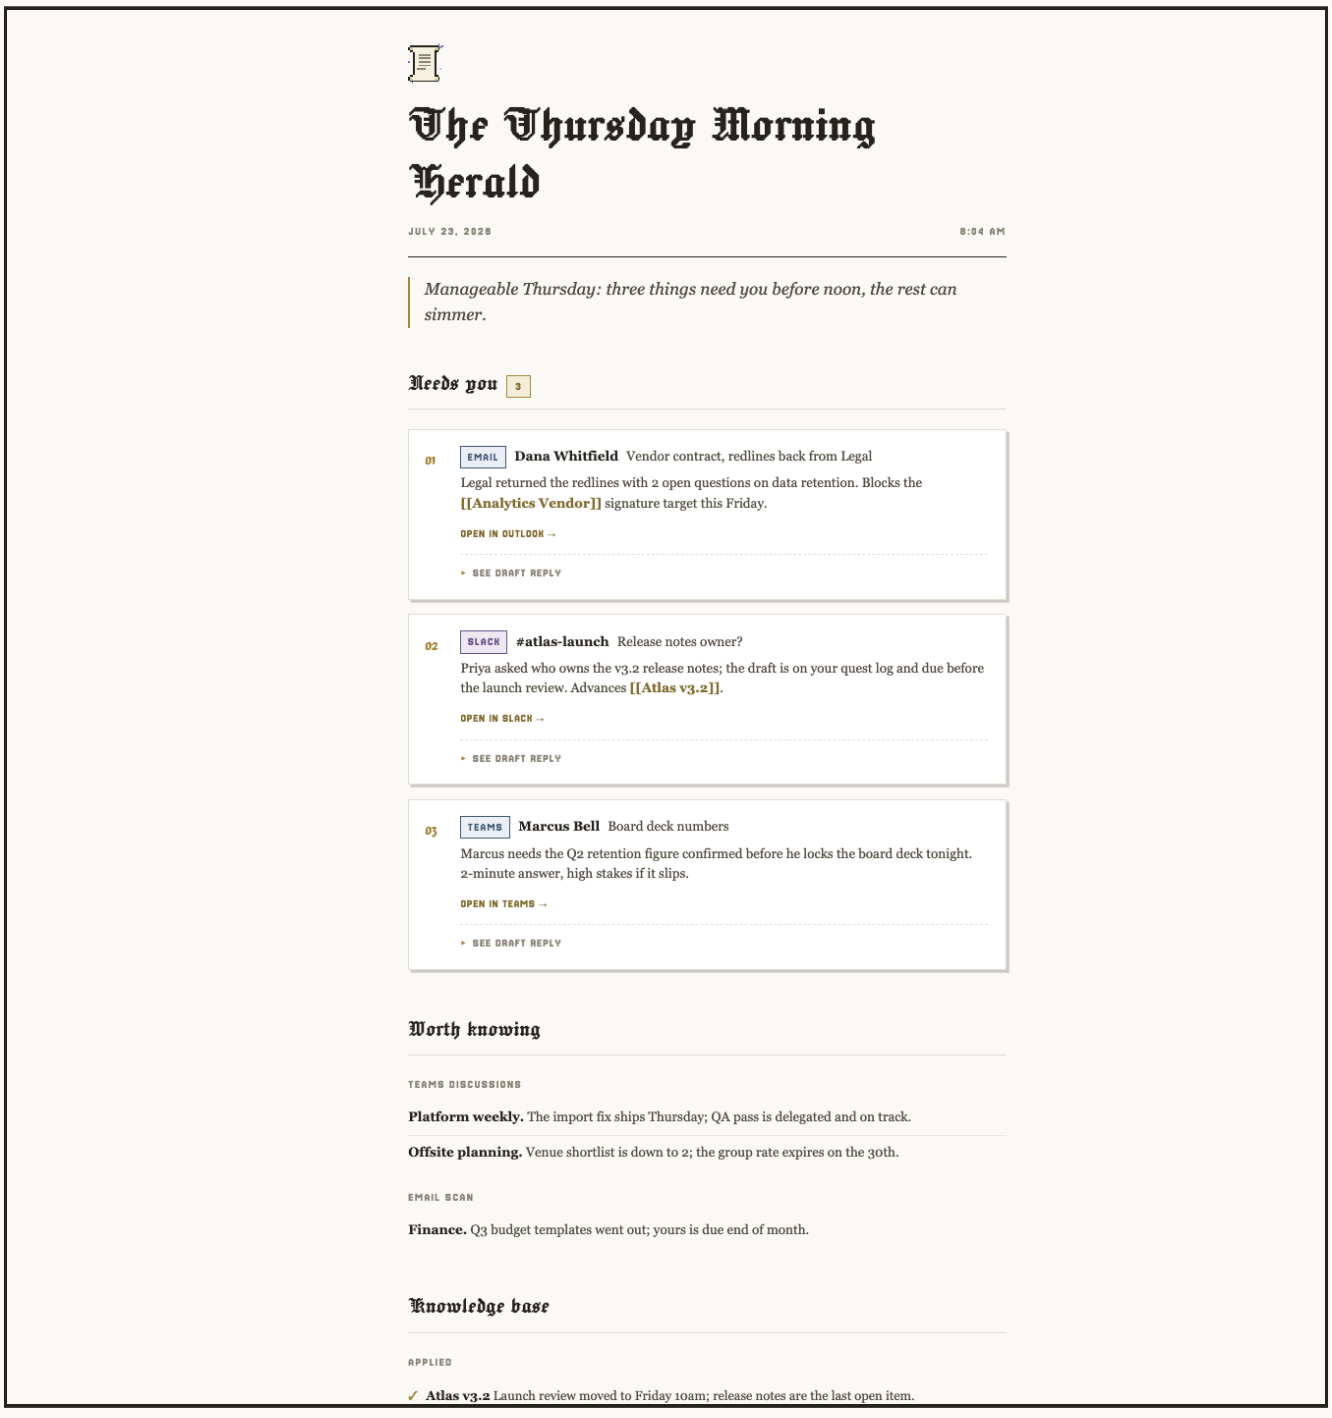

Every file is plain markdown. If something Lore wrote is wrong, fix the file directly; it reads your edits next session and treats corrections as lessons.

LOCAL-FIRST BY DESIGN

Every file lives on your machine. Nothing is uploaded unless you ask Lore to use a connector, and updates can never touch your personal files.

The Herald

Your daily brief: what needs you, drafts held for your review, and what Lore learned. Each one opens as a private page on claude.ai.

The Thursday Morning Herald

JULY 23, 2026 — 8:04 AM

> *Manageable Thursday: three things need you before noon, the rest can simmer.*

Needs you 3

01 EMAIL **Dana Whitfield** Vendor contract, redlines back from Legal

Legal returned the redlines with 2 open questions on data retention. Blocks the **[[Analytics Vendor]]** signature target this Friday.

OPEN IN OUTLOOK →

▸ SEE DRAFT REPLY

02 SLACK **#atlas-launch** Release notes owner?

Priya asked who owns the v3.2 release notes; the draft is on your quest log and due before the launch review. Advances **[[Atlas v3.2]]**.

OPEN IN SLACK →

▸ SEE DRAFT REPLY

03 TEAMS **Marcus Bell** Board deck numbers

Marcus needs the Q2 retention figure confirmed before he locks the board deck tonight. 2-minute answer, high stakes if it slips.

OPEN IN TEAMS →

▸ SEE DRAFT REPLY

Worth knowing

TEAMS DISCUSSIONS

Platform weekly. The import fix ships Thursday; QA pass is delegated and on track.

Offsite planning. Venue shortlist is down to 2; the group rate expires on the 30th.

EMAIL SCAN

Finance. Q3 budget templates went out; yours is due end of month.

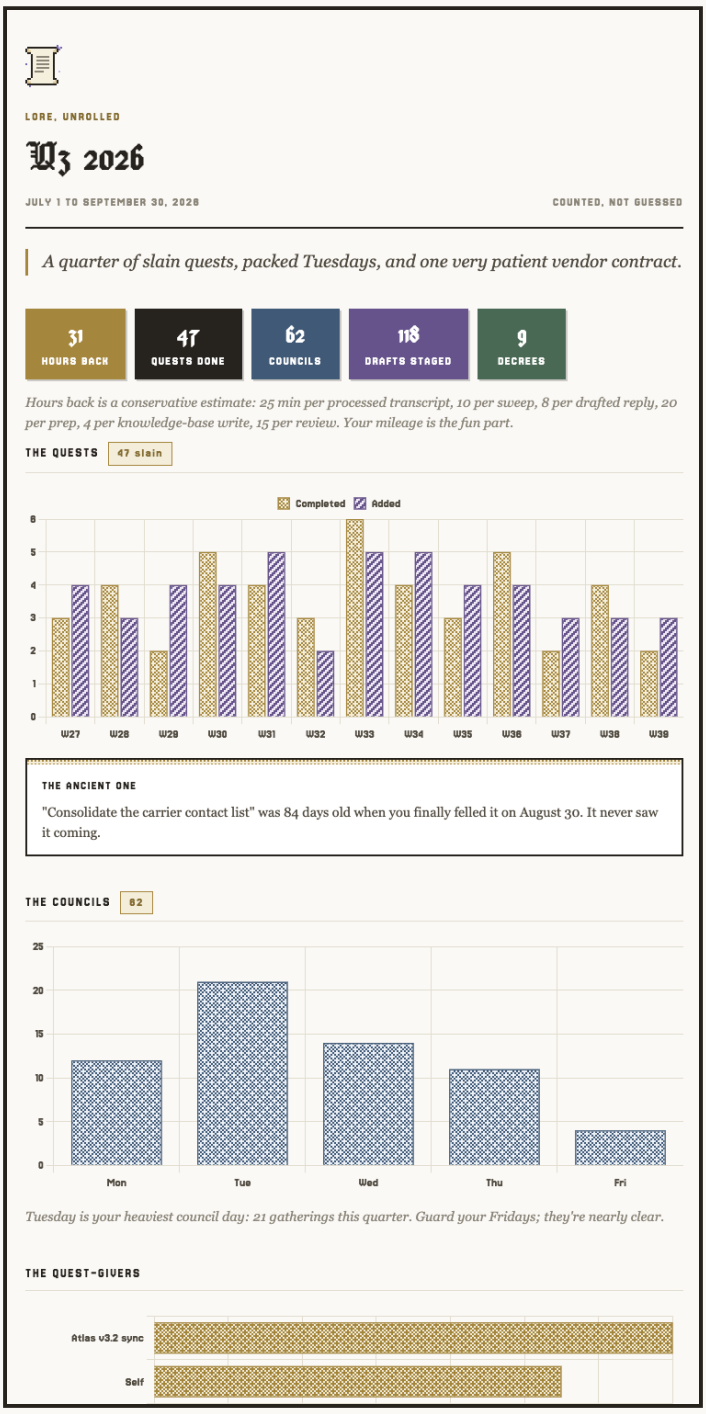

Knowledge base

APPLIED

✓ **Atlas v3.2** Launch review moved to Friday 10am; release notes are the last open item.

Lore, Unrolled

Say "unroll my scroll" when a quarter closes: your quests, councils, and channels in dithered charts, every number counted from your own records, plus a math-shown estimate of the hours Lore gave back.

FOR THE CURIOUS

The advanced shelf

None of this is required. Come back when you're ready for it.

NOTION OR OBSIDIAN

Lore keeps its knowledge (people, projects, meetings, decisions) in this folder by default. If your team lives in Notion, say **"set up Notion"** and it builds a private library there with two-way links; if you keep an Obsidian vault, it can use that instead, with wikilinks and backlinks. Either way each fact lives in one place and every page shows what links to it.

SPECIALIST SIDEKICKS

Lore plays well with sibling agents. Every action item carries two flags: **Lore** (Lore could do this itself) and **Specialist** (an executor agent could pick it up autonomously). Flag an item Specialist and a companion agent, our reference one is called Sigil, can do the work off-session and mark the item complete in your tracker. The wiring prompt is in the README under *Companion specialist agents*.

MAKE IT YOURS

Lore's personality and rules are plain files you're allowed to edit: `VOICE.md` is the style contract every artifact is checked against, `workflows/` holds the playbooks, and `CLAUDE.md` is the constitution. Change a file and the next session behaves accordingly. A quick map of the folder:

```
lore/
├── CLAUDE.md        how Lore behaves (read first, every session)
├── VOICE.md         the style contract
├── context.md       your profile (created by onboarding, private)
├── workflows/       one playbook per task
├── inbox/           drop things here for Lore to process
├── outbox/          briefs, preps, and drafts land here
└── team/ stakeholders/ meetings/ decisions/   the memory
```

QUESTIONS

Daily use, migrations after an update, and fixes for common snags are all in **The Keeper's Grimoire** (`docs/lore-grimoire.pdf`). Want help adopting Lore, or have an idea for it? Reach out to Colton Marshall.

May your scroll stay short.
