

The Keeper's Grimoire

LORE IN DAILY USE · V1.1, OCTOBER 2026

For keepers already in the field. The setup guide gets you started; this book is for the days after: what changed, what to say, and what to do when something looks off.

HOW TO READ IT

IF YOU ARE	START AT
Updating from an earlier Lore	**What's new** (page 2), then **Your migrations** (page 3)
New, and onboarding just finished	**The Quest Log** (page 4) and **Spells for every day** (page 7)
Adding or switching tools	**Your tools** (page 5)
Deciding where notes should live	**Where your knowledge lives** (page 6)
Stuck	**When something looks off** (page 8)

THIS RELEASE AT A GLANCE

ONE LIST, TWO HANDS

The Quest Log keeps its items in its own database. Lore reads and writes the same list you do: no more downloading snapshots.

YOUR TOOLS, YOUR WAY

Lore asks what you use for email, chat, meetings and tracking, wires up what's connected, and tells you where to connect the rest.

NOTION AS MEMORY

Keep people, projects, meetings and decisions in your private Notion space, with two-way links and backlinks.

UPDATES THAT FINISH THEMSELVES

When a release reshapes your data, Lore runs the steps for you after the update and asks before anything you'd notice.

THE RULE THAT NEVER CHANGES

Lore drafts and holds; it never sends. Every reply, update and message waits for you.

THE LATEST CHAPTER

What's new in v1.1

October 2026. Everything here arrives with the update; anything that touches your own data runs as a migration (next page).

CHANGE	WHAT IT MEANS FOR YOU
The Quest Log has its own database	It now lives on claude.ai, private to you, and opens in the browser or in Cowork. Lore reads it directly, so "what's on my plate" is always current. Download snapshot is now only a backup.
Triage: Already done	A fifth button on triage cards files an item straight to Completed.
Undo a check-off	Checking an item strikes it through for five seconds before it completes. Uncheck to undo.
Delegate to anyone	Type any name in the delegate picker, not only people on your team list.
Tools by role	Lore records which tool you use for each job and only sweeps those. Say "check my connectors" after connecting something new.
Notion knowledge base	A third home for Lore's memory, beside this folder and Obsidian. Say "set up Notion" or "migrate to Notion".
Smarter triage	No drafts for threads you already answered, a last-second re-check before each draft, and Outlook links that open the draft itself.
Recaps count your sessions	Weekly reviews, 1:1 prep and Unrolled include what you did in Claude sessions, and say which sessions they could see.
Your timezone, on record	Every time in a brief converts through the zone you gave Lore, never a guess.
Screenshots in documents	Preps and reports can carry images inline.
Recordings stay in their app *(v1.1.1)*	Lore no longer copies full transcripts into your notes. Each meeting note carries a link back to the recording and keeps your own notes and highlights word for word, so processing uses far fewer tokens. Notion libraries lose their Transcripts database (a migration).

NOTHING YOU WROTE WAS TOUCHED

Updates only replace Lore's own playbooks and templates. Your profile, team pages, notes and Quest Log items stay exactly as they were until a migration asks to move them.

FOR RETURNING KEEPERS

Your migrations

Right after an update, Lore lists the setup steps your install still needs. It does the quiet ones and asks before the rest. Put any off and it offers them again next session.

MIGRATION	WHAT HAPPENS	YOU'LL BE ASKED
Move the Quest Log	Lore creates the new tracker and copies every item across with its original dates. It needs one last snapshot from the old tracker: open it in the Cowork sidebar and click Download snapshot when asked.	Yes, to start and for the snapshot
Record your timezone	One question. Every time Lore renders depends on it.	Yes
Build your connectors table	Lore checks what's connected and fills in what it already knows; it asks only about roles nothing answers.	Only for gaps
Session history folder	Creates the folder recaps read your Claude Code history from.	No
Retire old snapshot files	Offers to move old snapshot files into `inbox/archive/`. Never deletes them.	Yes
Retire Notion Transcripts	Notion libraries only. Moves each recording link onto its meeting page, then offers to put the old Transcripts database in Notion's trash.	Yes, before the trash
Offer Notion	If Notion is connected, one offer to move your knowledge base there. Say no and it won't ask again.	Yes, once

RUNNING THEM YOURSELF

YOU WANT TO	SAY
Do everything that's pending	`"Run migrations"`
Wait until later	`"Later" (it asks again next session)`
See what's done	`"Which migrations have run?"`

The record lives in `inbox/.migrations`, one line per finished step. Each one checks before it acts, so running it twice changes nothing.

AFTER THE QUEST LOG MOVES

The old sidebar tracker is frozen. Lore stops reading it; delete it from Cowork whenever you like. Your new tracker's link is saved in your profile, and "open my quest log" brings it up.

The Quest Log

Your one list of action items. You work in it; Lore works in it too, and changes appear for both of you as they happen.

THE TRIAGE PILE

Items Lore finds in meetings and messages arrive as cards, one at a time, oldest first. One click decides each:

BUTTON	RESULT
Do now	Active, due ASAP, top of the list.
Already done	Straight to Completed, today's date.
Schedule…	Active with the date or words you pick.
Delegate…	Straight to Delegated: a teammate, or any name you type.
Delete	Gone from view, and Lore remembers you threw it away so it never proposes it again. Undo covers a mis-click.

WORKING THE LIST

Check it off: the row strikes through for five seconds, then completes. Uncheck to undo. **Edit in place:** click a subject, source, due date or note. **Filters:** Overdue, Due Soon, ASAP, TBD, Lore-Ready, Specialist-Ready, Stale. **Flags:** Lore means Lore could do it for you; Specialist means a companion agent could.

ASKING LORE ABOUT IT

YOU WANT TO	SAY
See what's on your plate	`"What's on my plate?"`
Add something	`"Add: send the renewal quote to Sam by Friday"`
Close or hand off	`"Mark the vendor review done"` / `"Delegate X to Avery"`
Review the pile	`"What's in my triage queue?"`

BACKUPS AND SHARING

Download snapshot saves a markdown copy; Restore from backup puts one back after asking. The tracker is private to you. Share it from its Share menu and editors can work the list too.

YOUR INSTRUMENTS

Your tools

Lore asks what you use for each job instead of assuming. Whatever is connected gets wired in; the rest is noted, with where to connect it.

ROLE	WHAT IT UNLOCKS	FOR EXAMPLE
Email	The email sweep in triage, reply drafts, the Herald	Outlook, Gmail
Team chat	The chat sweep, drafts, knowledge sweeps	Slack, Teams
Calendar	Morning sync and prep timing	Outlook, Google
Meeting notes	Transcript processing and proposed action items	A recorder app, Notion AI notes
Work tracker	Ticket context in drafts and recaps	Linear, Jira, Asana
Docs and wiki	Linked-doc context, document ingest	Notion, Confluence, Drive
Shared inbox	Noted now; a triage source later	Front, Zendesk

CONNECTING SOMETHING NEW

Add the connector in claude.ai under Settings, then Connectors (or the connectors menu in a Cowork chat), then tell Lore: "**I connected Linear**" or "**check my connectors.**" Lore confirms it works with one read-only call, asks the few scoping questions it needs (your channels, your project keys), and adds it to your profile. If it unlocks the daily brief, Lore offers to schedule it.

CHANGING TOOLS

Say "**I switched email to Gmail**" and Lore updates that one role. A tool with no connector yet is recorded honestly: Lore tells you it can't read it, and you forward or paste what you want it to see.

WHAT LORE WILL NEVER DO

Use a connector you didn't name for that job, write anything while testing a connector, or look outside the channels, projects and spaces you gave it.

THE LIBRARY

Where your knowledge lives

Lore keeps a page for every person, project, meeting and decision it learns about. Choose where those pages live.

HOME	BEST FOR	SET UP BY SAYING
This folder	The default. Plain files on your computer; nothing to install.	`(nothing to set up)`
Notion	Teams already in Notion. Two-way links between every page; reachable from any device.	`"Set up Notion"`
Obsidian	Keepers who already keep a vault and want its graph view.	`"Set up Obsidian"`

INSIDE THE NOTION LIBRARY

A private **Lore** page in your Notion space holds five databases: **People**, **Projects**, **Meetings** (each linking back to its recording), **Decisions** and **Notes**, plus a **Context** page and a **Commitments** page.

IN OBSIDIAN	IN NOTION
Frontmatter	Database properties: relationship, status, team, dates
Wikilinks and backlinks	Two-way relations: set a project's lead and the person's page lists it under Leads
Dataview tables	Views on each page: a person's projects and meetings appear on their own
The Archive folder	An Archived checkbox. Nothing is ever deleted

MOVING HOUSE

Say **"migrate to Notion"** and Lore counts what you have, shows three pages as they'll look, and waits for your yes. It copies people first, then everything that links to them, and leaves the originals where they were until you remove them.

WHO CAN SEE IT

Pages in your private Notion space are yours. On some Notion plans, workspace admins can still reach private content; keep that in mind for 1:1 notes.

INCANTATIONS

Spells for every day

Plain words work. These are the ones keepers reach for most.

WHEN	SAY
Morning	`"Morning sync"` · `"Triage everything"`
After a meeting	`"Process this transcript"` · `"Sync my recorder from today"`
Raw notes or a doc	`"I have some notes"` · `"Ingest this document"`
Before a 1:1	`"Prep for my 1:1 with [name]"`
Before a team meeting	`"Prep for Friday's roundtable"`
Promises in flight	`"What am I waiting on?"` · `"Track this promise"`
Relationships	`"Who am I overdue to see?"`
A hard call	`"Help me think through [decision]"` · `"Poke holes in this"`
End of a session	`"Wrap up this session"` · `"Write a handoff"`
Friday	`"Run my weekly review"` · `"Lint the vault"`
Quarter's end	`"Unroll my scroll"`
Housekeeping	`"Update Lore"` · `"Check my connectors"`

GETTING THE MOST FROM RECAPS

Recaps count what happened in your Claude sessions as well as your messages and notes. Cowork sessions are read directly. For Claude Code sessions, run `node scripts/build-cc-session-digest.js --days 90` from Claude Code in your Lore folder now and then; Lore tells you when its view is out of date and always says which sessions a recap covered.

TEACHING LORE

Correct anything it gets wrong, in plain words. Lore fixes the output and writes the lesson into the file that prevents a repeat, then tells you where. Style corrections become rules in `VOICE.md`; facts go to the right page.

When something looks off

Most surprises have a one-line fix.

YOU SEE	TRY
The Quest Log says it can't reach its database	Open it on claude.ai while signed in, or reload it. It saves nothing until it reconnects.
Lore says it can't find your Quest Log	Say "find my quest log". If you never moved to the new tracker, say "run migrations".
The Herald skipped your email or chat	"Check my connectors". A connector that needs signing in again shows as needs reconnecting.
A source shows as "not swept yet"	Lore knows you use that tool but can't read it yet. Forward or paste what matters.
Times in a brief are an hour off	"My timezone is [zone]". Use the name, like America/Phoenix, not a region.
Lore can't reach your notes	The folder isn't connected to this session, or Notion is disconnected. Add it back in the project settings; Lore won't write notes anywhere else meanwhile.
A draft replies to something you already answered	Tell Lore. It checks the thread's last message before every draft and treats a miss as a lesson to fix.
An update was offered but you're busy	Say "later". Nothing changes until you say "update".

KEEPING THIS BOOK CURRENT

Every Lore release that changes what you see or say updates this grimoire, starting with What's new. The newest copy is always at `docs/lore-grimoire.pdf` in your Lore folder.
